| $\begin{aligned} & \text { MA 120-04 } \\ & \text { §4.6, 5.1-5.3 } \end{aligned}$ | Quiz \#6 | score | Name: $\qquad$ |
| :---: | :---: | :---: | :---: |

1. Suppose a demand function is given by the equation $q=10000-p^{2}$ where $q$ is the number of items and $p$ is the price in dollars per item. Determine the elasticity when the price is $\$ 50$ and again when the price is $\$ 60$. At each price, explain whether you should increase the price or decrease the price in order to increase revenue? (7 points)
2. The table shown below gives the velocity $v(t)$ of a car (in feet/second) at time $t$ (in seconds). Using the the given data, find upper and lower estimates (using left sums and right sums) of the total distance covered by the car until it comes to a stop. (7 points)

| $t$ | 0 | 2 | 4 | 6 | 8 | 10 |
| :---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $v(t)$ | 105 | 104 | 99 | 84 | 53 | 0 |

3. Find the exact value of

$$
\int_{0}^{6} f(x) d x
$$

for the given function that consists of straight-line segments. (6 points)
